Let V be a finite dimensional vector space. The mapping  $\|\cdot\|:V\to\mathbb{R}$  is called a vector norm if

- $||\mathbf{v}|| \ge 0$ , for all  $\mathbf{v} \in V$  (positivity),
- $\|\mathbf{v}\| = 0 \Leftrightarrow \mathbf{v} = 0_V$  (definition),
- $\|\alpha \mathbf{v}\| = |\alpha| \|\mathbf{v}\| \text{ for all } \alpha \in \mathbb{K} \text{ and } \mathbf{v} \in V \text{ (homogeneity)},$
- $||\mathbf{u} + \mathbf{v}|| \le ||\mathbf{u}|| + ||\mathbf{v}||$  for all  $\mathbf{u}, \mathbf{v} \in V$  (triangle inequality).

# Example 1

Let  $V=\mathbb{R}^n.$  The following define the traditional Minkowski p norms, for a real number  $p\geq 1$ :

$$\|\mathbf{x}\|_p = \left(\sum |x_i|^p\right)^{1/p}.$$

Some people call this also Hölder's norm.

Particular examples include:

- p=2: Euclidean norm
- p = 1: Manhattan or Taxicab norm
- As  $p \to \infty$ , we define the *infinity norm* as  $\|\mathbf{x}\|_{\infty} = \max_i |x_i|$ .

Let  $\infty \ge q \ge p \ge 1$ . It holds

$$\|\mathbf{x}\|_{p} \leq \|\mathbf{x}\|_{q} \leq n^{1/q-1/p} \|\mathbf{x}\|_{p}.$$

Two norms  $N_1$  and  $N_2$  are said to be **equivalent** if there exist two constants  $\alpha$  and  $\beta$  such that

$$\alpha N_1(\mathbf{v}) \le N_2(\mathbf{v}) \le \beta N_1(\mathbf{v}), \text{ for all } \mathbf{v} \in V.$$

Assume  $(\mathbf{x}^{(k)})_k$  is a convergence sequence with respect to a norm  $N_1$ . If  $N_2$  is equivalent to  $N_1$  then  $(\mathbf{x}^{(k)})_k$  is also convergence with respect to  $N_2$ .

On a finite dimensional vector space, all norms are equivalent.

# Example 2

Let N be defined as

$$N(\mathbf{u}) = (|2u_1 + 3u_2|^2 + |u_2|^2)^{1/2}.$$

Does N define a norm?

Let  $A:V\to W$  be a linear function where  $\dim(V)=n$  and let  $\|\cdot\|$  define a norm on W. If rk(A)=n then  $\|A(\mathbf{x})\|$  is a norm.

Let  ${\bf u}$  and  ${\bf v}$  be two n-dimensional vectors. Then Hölder's inequality holds

$$\sum_{i=1}^n |u_i v_i| \le \|\mathbf{u}\|_p \|\mathbf{v}\|_q,$$

where p and q are such that 1/p + 1/q = 1.

Lemma 1 (Young's inequality for product)

Let a and b be non-negative real numbers and 1 . It holds

$$ab \le \frac{a^p}{p} + \frac{b^q}{q}.$$

A vector space  $(V, \|\cdot\|)$  is said to be a normed vector space if

- ullet V is a vector space over  $\mathbb K$  and
- || ⋅ || is a norm.

If moreover V is complete (every Cauchy sequence in V converge in V) we call it a Banach space.

Let V be a vector space over the field  $\mathbb{K}$ . The binary function  $\langle\cdot,\cdot\rangle:V\times V\to\mathbb{K}$  is called an inner product if for all  $\mathbf{u},\mathbf{v},\mathbf{w}\in V$ 

- $(\mathbf{u}, \mathbf{u}) = 0 \Leftrightarrow \mathbf{v} = 0,$
- $\langle \alpha \mathbf{u}, \mathbf{v} \rangle = \alpha \langle \mathbf{u}, \mathbf{v} \rangle$ , for all scalar  $\alpha \in \mathbb{K}$ ,

One may say that the inner product is a positive definite sesquilinear form.

Let V be a vector space and  $\langle \cdot, \cdot \rangle$  be an inner product. The mapping  $\| \cdot \|$  defined for  $\mathbf{u} \in V$  as  $\|\mathbf{u}\|^2 = \langle \mathbf{u}, \mathbf{u} \rangle$  is a norm on V.

# Proposition 7 (Cauchy-Schwarz)

Let  $\langle \cdot, \cdot \rangle$  be an inner product on V. It holds, for all  $\mathbf{u}, \mathbf{v} \in V$ 

$$|\langle \mathbf{u}, \mathbf{v} \rangle| \leq \|\mathbf{u}\| \|\mathbf{v}\|,$$

where  $\|\cdot\|$  is the norm induced by the inner product.

#### Exercise 1

Show that the equality in Cauchy-Schwarz inequality occurs if and only if  ${\bf u}$  and  ${\bf v}$  are linearly dependent.

A vector space equipped with an inner product is called an **inner product** space.

If the space is also complete, we call it a Hilbert space.

# Exercise 2

Show that the trace defines an inner product on the space of matrices:

$$\langle A, B \rangle = tr(B^*A).$$

The associated norm is called the **Frobenius**, denoted  $\|\cdot\|_F$ . What is  $\|A\|_F^2$ ?

An inner product  $\langle \cdot, \cdot \rangle$  fulfills the following basic properties (in an vector space V on the field of scalar  $\mathbb{K}$ ):

- Let  $\mathbf{u} \in V$ ,  $T_{\mathbf{u}} : V \to \mathbb{K}$  defined for all  $\mathbf{v} \in V$  as  $T_{\mathbf{u}}(\mathbf{v}) = \langle \mathbf{u}, \mathbf{v} \rangle$  is a linear map from V to  $\mathbb{K}$ .
- $\langle 0, \mathbf{u} \rangle = 0 = \langle \mathbf{u}, 0 \rangle$  for every  $\mathbf{u} \in V$ .
- $\langle \mathbf{u}, \mathbf{v} + \mathbf{w} \rangle = \langle \mathbf{u}, \mathbf{v} \rangle + \langle \mathbf{u}, \mathbf{w} \rangle$ , for every  $\mathbf{u}, \mathbf{v}, \mathbf{w} \in V$ .
- $\langle \mathbf{u}, \lambda \mathbf{v} \rangle = \overline{\lambda} \langle \mathbf{u}, \mathbf{v} \rangle$ , for every  $\mathbf{u}, \mathbf{v} \in V$  and  $\lambda \in \mathbb{K}$ .

Let  $V, \langle \cdot, \cdot \rangle$  be an inner product space. Two vectors  $\mathbf{u}, \mathbf{v}$  are called **orthogonal** 

$$\langle \mathbf{u}, \mathbf{v} \rangle = 0.$$

Let  $V, \langle \cdot, \cdot \rangle$  be an inner product space. Two families of vectors S and T are called **orthogonal** if

$$\langle \mathbf{u}, \mathbf{v} \rangle = 0, \ \text{for all } \mathbf{u} \in S, \mathbf{v} \in T.$$

# Exercise 3

Prove the Pythagorean theorem: if  $\mathbf u$  and  $\mathbf v$  are two orthogonal vectors, then

$$\|\mathbf{u} + \mathbf{v}\|^2 = \|\mathbf{u}\|^2 + \|\mathbf{v}\|^2,$$

where  $\|\cdot\|$  denotes the norm induced by the given scalar product.

A vector is said to be unit norm or normalized if  $\|\mathbf{u}\| = 1$ . A family of vectors is said to be orthonormal if it is a family of unit-norm vectors and orthogonal.

A family of p vectors is orthonormal if and only if the matrix U containing those vectors column-wise is such that  $U^TU=I_p$ .

Proposition 10 (Gram-Schmidt)

Let  $S = (\mathbf{v}_1, \dots, \mathbf{v}_k)$  be a linearly independent family vectors. Then there exists an orthonormal family  $(\mathbf{w}_1, \dots, \mathbf{w}_k)$  such that  $\mathrm{span}(\mathbf{v}_1, \dots, \mathbf{v}_j) = \mathrm{span}(\mathbf{w}_1, \dots, \mathbf{w}_j)$  for all  $1 \leq j \leq k$ .

A square matrix  $A \in \mathbb{K}^{n \times n}$  is called unitary (resp. orthogonal) if

$$A^*A = AA^* = I_n$$
 (resp.  $A^TA = AA^T = I_n$ ).

#### Exercise 4

Show that for U a unitary matrix,  $|\det(U)|=1$ . What does it mean for a real orthogonal matrix?

Let  $A \in \mathbb{K}^{n \times n}$ . The following statements are equivalent

- A is unitary.
- ② A preserves the  $\ell^2$  norm:  $||A\mathbf{u}|| = ||\mathbf{u}||$ , for all  $\mathbf{u} \in \mathbb{K}^n$ .
- $\bullet$  The columns of A form an orthonormal system.
